

Shop Management System Guide

What is This System?

The Shop Management System is like a digital helper for a shop owner named Sam, who runs **Sam's Snack Stop**, where he sells snacks, drinks, and toys. It's a super-smart notebook that keeps track of everything in his shop—products, customers, sales, suppliers, subscriptions, and more—so Sam doesn't need to write things on paper. This guide explains what the system does, who uses it, and how it handles all possible cases, using simple examples a 7th grader can understand.

Why Use This System?

The system helps Sam:

- Keep his shop organized and accurate.
 - Save time by storing everything digitally.
 - Avoid mistakes, like selling items that are out of stock.
 - Make smart decisions, like knowing which products sell best.
 - Keep customers, suppliers, and service providers happy with clear records.
-

What the System Does

Here are the main features of the system, with examples from Sam's shop:

1. Shop Details

Stores information about Sam's shop, like its name, address, phone number, and email.

Example: Sam enters his shop's address so customers can find it on a map or call to ask about products.

2. Products

Tracks:

- Name (e.g., “Choco Bar”)
- Price (e.g., \$1)
- Stock quantity (e.g., 20 bars left)
- Category (e.g., “Snacks” or “Toys”)
- Barcode and batch number
- Description (e.g., “Chocolate candy bar, 50g”)
- Low stock threshold
- Expiration date
- Image (optional)

Example: Sam adds “Toy Car” for \$5, notes it’s in the “Toys” category, and sets a low stock warning for when he has only 5 left.

3. Sales

Tracks:

- What was sold
- Price
- Taxes
- Discounts
- Payment type (cash, debit, credit)
- Sale status (completed, returned, pending)

Example: A kid buys 3 candies for \$3. With 5% tax (\$0.15), the total is \$3.15, paid in cash. If paid later, the system notes the due date.

4. Purchases

Tracks:

- What Sam bought from suppliers
- Cost, taxes, discounts
- Payment type
- Status (pending, completed, canceled)

Example: Sam orders 100 sodas for \$50 from SnackCo, to be paid in 30 days (credit). The system marks it as pending until paid.

5. Discounts

Allows:

- Percentage discounts (e.g., 10% off)
- Fixed discounts (e.g., \$2 off)

Example: A customer buys a \$10 toy with a 10% discount, paying \$9 plus tax.

6. Taxes

Allows Sam to set up taxes like a 5% sales tax.

Example: A \$10 toy gets a \$0.50 tax added, totaling \$10.50.

7. Returns

Customer Returns: Tracks quantity, reason, refund amount, payment type (cash, credit, bank transfer, or store credit).

Example: Alex returns a broken toy worth \$5. Sam gives store credit, and the stock updates.

Supplier Returns: Tracks returned goods to suppliers.

Example: Sam returns 5 cracked soda bottles to SnackCo and gets a refund.

8. Stock Adjustments

Used for lost, stolen, broken, or miscounted items.

Example: Sam finds 2 broken toy cars and updates stock, noting the reason. If 4 chip packs are stolen, he notes “possible theft.”

9. Payments

Tracks:

- Money in (sales or customer payments)
- Money out (suppliers, refunds)
- Date and payment method

Example: Sam pays \$50 to SnackCo by bank transfer. A customer pays \$10 in cash.

10. Subscriptions

Tracks services Sam pays for regularly.

Includes:

- Plan name
- Billing cycle
- Amount
- Start and end dates
- Status (active, expired, canceled)
- Payment status
- Trial period

Examples:

- **Active:** \$10/month for a delivery app.
 - **Trial:** Free shop app for 30 days.
 - **Expired:** Delivery app not renewed.
 - **Canceled:** Marketing app canceled.
 - **Failed Payment:** Card declined.
 - **Yearly:** \$100 for yearly software plan.
-

11. Audit Logs

Logs all actions with who did what and when.

Example: Mia enters a wrong price. Sam corrects it. The system logs both.

Who Uses the System?

1. Super Admin

- Manages all shops
- Fixes problems
- Adds new shops

Example: Helps Sam set up or solve issues.

2. Shop Owner (Sam)

- Manages products
- Checks sales
- Orders stock
- Handles subscriptions

Example: Sam adds “Choco Bars” and checks subscriptions.

3. Cashier (Mia)

- Records sales
- Applies discounts
- Handles returns

Example: Mia sells \$3 worth of candy and processes a \$5 return.

4. Customer

- Buys items
- Returns products
- May have credit tracked

Example: Alex buys and returns a toy for \$5 in store credit.

5. Supplier

- Sells to Sam
- May receive returns
- Payments tracked

Example: SnackCo delivers chip packs; 5 are returned damaged.

Handling Lost or Broken Products

Stock Adjustments

Used when items are lost, stolen, or broken.

Example: Sam updates stock from 100 to 96 due to “Missing, possible theft.”

Supplier Returns

Used if damaged goods came from a supplier.

Example: Sam returns 5 cracked sodas from delivery.

Why This System is Awesome

- Keeps everything organized and accurate
 - Saves time with digital records
 - Prevents out-of-stock sales
 - Helps Sam make smart decisions
 - Keeps everyone happy with clear records
-

Final Note

The Shop Management System makes running Sam’s Snack Stop super easy. It tracks products, sales, customers, suppliers, subscriptions, and more, helping Sam, Mia, and everyone keep the shop running smoothly and successfully!
